```
The present invention relates to coding sequences (see AP44740-F44840 and AAF44843-F44844) and proteins (see AAB65714-B65814) involved in programmed cell death (PCD, apoptosis). The coding sequences and proteins of the present invention are useful for modulating a PCD or cell death pathway and various developmental pathways in a forestry plant, by stably incorporating one of the present coding sequences into the genome of the forestry plant, where he coding sequence provides a PCD pathway that is not present in a native form of the forestry plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                    61 WNIGGLLTTMACMGSMVWLLSAPPYQEQKRVALLMAAALFEGASIGPLIELGINFDPSIV 120

                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                               ð
                                                                                                                                                                                                                                                                                                          5;
                                                                           The present invention relates to coding sequences (see AAF44740-F44840 prod AAF4443-F44844) and proteins (see AAB65714-B65814) involved in programmed cell death (PCD; apottosis). The coding sequences and proteins of the present invention are useful for modulating a PCD or cell death pathway and various developmental pathways in a forestry plant, by stably incorporating one of the present coding sequences into the genome of the forestry plant, where the coding sequence provides a PCD pathway that is not present in a native form of the forestry plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel defender against cell death polynucleotide useful for modulating programmed cell death pathway and specific development pathways in

                                                                                                                                                                 1; Gaps
                                                                                                                                                                                                      The present invention relates to proteins derived from bovine mammary gland cells. The invention is useful for stimulating bovine mammary gland cell growth and function, inhibiting the growth of various mammary gland cancer cells, inhibiting anglogenesis and vascularization of tumours, or modulating the growth of blood vessels in a mammal.

gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases. Polynucleotide sequences AAF18425 - AAF18433 and peptide AAF86459 are used in the course of the invention for the identification and characterisation of the polynucleotide and protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
           This is the amino acid sequence of an inhibitor protein, termed .

B1-1, of the pro-apoptotic protein Bax. Nucleic acids encoding
B1-1 (see AAVS9067) and B1-2 (see AAVS9068) were identified by
suppression of Bax-induced death of yeast cells transformed to
suppression of Bax-induced death of yeast cells transformed to
express human Bax. A human HepG2 cDNA library was used for library
containing. The invention provides vectors, optionally expression
or viral vectors, containing B1 nucleic acids, and host cells
containing these vectors. The nucleic acids encoding B1-1/B1-2 can
be used to increase expression of these proteins in cells, or
antisense molecules prepared from them used to decrease expression.
In these ways, cellular apoptotic activity may be modulated. The
B1s and peptides portions are useful to detect, e.g. another B1 or a
member of the Bc1-2 family in biological samples. They are
cespecially useful in assays to identify agents (e.g. organic
cespecially useful in assays to identify agents (e.g. organic
college or peptides; claimed) modulating the specific association
of B1-1/B1-2 with a second protein (e.g. a B1, an anti-B1 antibody
cor a Bc1-2 family protein (e.g. Bax) (claimed)) e.g. in screening
cor alellular apoptotic activity (claimed). Bax overexpression is
cellular apoptotic activity (claimed). Bax overexpression is
cellular apoptotic activity (claimed). Bax overexpression is
spinal cord injuéry Parkinson's disease and Alzhaimer's disease.
Antibodies raised against the B1s and peptides are also useful e.g.
to detect/quantify B1s in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       187

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABG\$4131-ABG\$6305), and also cencempasses polypeptides 90% identical and polymolecides 95% identical to the sequences of the invention. The invention additionally relates to correct and bost cells comprising human ovarian antigens and the use of ovarian antigens, and the use of ovarian antigens, and the use of ovarian antigens, and the use of ovarian antigens and polypeptides in diagnosing, treating, prognosing or preventing various ovarian antigens, and the use of sorders. Such conditions include ovarian cancer and breast cancer, and disorders (e.g., infertility, disorders of pregnancy, anovulation, clisorders, infertinity, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorshoea), endocrine disorders, infertions (e.g., chlamydia (e.g., mastitis, opphoritis and ovaginitis), immune disorders (e.g., congenital and acquired toxic of modulate ovarian antigen polypeptides and conformation of individuals and in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may be used in screening for compounds and the invention. Other individuals and in forensic analysis, and the invention. Other individuals and in forensic analysis, and the invention, but was obtained in electronic format directly from Wipport of For Wint for percents of the printed specification, but was obtained in electronic format directly from Wipport for the privation of the polymories. 78; Indels 11; DB 23; Length 245; 26.1%; Score 331.5; DB 2 34.8%; Pred.                                                                       8
                                                                                                       d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying at herapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptide. Vectors comprising the proteins are useful in genetic vaccination, testing and the proteins are useful in genetic vaccination, testing and the proteins are useful in genetic vaccination, to reginerate to express them and/or nerve tissue growth or regeneration; hone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or simulation, as anti-inflammatory agents; and in treatment of leukaemias. AAUSS10-AAU3304 represent the amino acid in treatment of leukaemias. AAUSS10-AAU3304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy -

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention suseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher exkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 detection reagent for detecting 1900 or more for elucidating cell signalling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention sussful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL30511), and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABL01840-ABL30512), and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

The present invention provides a method of diagnosing abnormal levels of growth hormone (GH) in brown adipose tissue, by assaying the levels of specific gene transcripts. The genes of interest are those encoding specific gene transcripts. The genes of interest are those encoding ubiquichly incomerate, neuroleukin, private kinase, haem oxygenase, ubiquitin/ribosomal fusion protein, alpha-enolase, proteasome theta adipocyte lipid binding protein, medium chain acyl-coA dehydrogenase, adipocyte lipid binding protein, michochondrial cytochrome B or any of the genes Ng-G119X2, Ng-119X5, Ng-119X5, Ng-119X5, Ng-119X6, Ng-119X6, Ng-119X6, This is useful for diagnosing abnormal levels of GH or predicting changes in brown adipose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosis of abnormal levels of growth hormone in brown adipose tissue is carried out by monitoring the transcriptional activity of one or more genes related to growth hormone activity -

Patent No. 6451604

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Flinn, Barry
APPLICANT: Lasham, Annette
TITLE OF INVENTION: Compositions affecting programmed cell
TITLE OF INVENTION: death and their use in the modification of forestry plant devel
FILE REFERENCE: 1022
CURRENT APPLICATION NUMBER: US/09/325,932A

CURRENT PILING DATE: 1999-06-04

NUMBER OF SEQ ID NOS: 206
SEQ ID NOS: 206
SEQ ID NO 872
SEQ ID NO 872
